INTRODUCTION

In the past years, endoscopic endonasal techniques underwent significant advances. Indeed, it is now possible to say that the nose and paranasal sinuses changed from just a potential site of various diseases to a natural surgical corridor toward hidden and deeper anatomical structures. Furthermore, the ability to resect and reconstruct skull base defects has dramatically improved, thus making endoscopic techniques a valuable tool for skull base surgeons. Given the ever expanding surgical options, a continuous improvement of anatomical knowledge is mandatory. However, thinking that the apex has already been reached would be erroneous.

For this reason, we designed a specific course where you will find the opportunity to attend classes of update on sinonasal pathology, specifically targeted on new diagnostic and surgical acquisitions and dissection on cadavers. The course includes a practical surgical training, which will be driven through operating sessions. The organization is residential with a daily basis (morning and afternoon) and with the constant presence of a tutor. Interaction with the faculty is facilitated by the small number of participants (max 12 members).
