INTRODUCTION

In the past years, endoscopic endonasal techniques underwent significant advances. Indeed, it is now possible to say that the nose and paranasal sinuses changed from just a potential site of various diseases to a natural surgical corridor toward hidden and deeper anatomical structures. Furthermore, the ability to resect and reconstruct skull base defects has dramatically improved, thus making endoscopic techniques a valuable tool for skull base surgeons. Given the ever expanding surgical options, a continuous improvement of anatomical knowledge is mandatory. However, thinking that the apex has already been reached would be erroneous.

For this reason, we designed a specific course where you will find the opportunity to attend classes of update on sinonasal pathology, specifically targeted on new diagnostic and surgical acquisitions. The course includes a practical surgical training, which will be driven through operating sessions. The organization is residential with a daily basis (morning and afternoon) and with the constant presence of a tutor. Interaction with the faculty is facilitated by the small number of participants (max 12 members).

Paolo Castelnuovo
